PCI DSS Blueprints Standardized GKE - based architecture for PCI-DSS on Google Cloud

The control mapping helps you assess compliance with a PCI requirement; however, there often isn't a one-forone mapping or complete match between a control implemented in the blueprint and the PCI requirement. It is important to note that the description of the implementation details in this blueprints must be reviewed, evaluated, assessed, and approved by your and your QSA, and layered with other security features that address all of the in-scope systems and applications for a holistic solution to meet the PCI requirements.

PCI DSS Requirements v3.2.1	Description of Implementation
Segmentation / Boundary Protection Note: Segmentation is not a PCI DSS requirement. However, it is strongly recommended as a method that can help to reduce the scope and cost of a PCI audit.	There are several ways to isolate your CDE within your organizational structure using Google Cloud's resource hierarchy. This blueprint implements a logical segmentation by using Google Cloud projects; the segmentation lets you create a boundary for your PCI assessment. This blueprints runs Istio on Google Kubernetes Engine (Istio on GKE) as an add-on that lets you create a service mesh around the GKE cluster that includes all the components you need. The blueprint also creates a security perimeter using VPC Service Controls around all of the Google Cloud projects that are in scope for PCI.
Requirement 1: Install and maintain a firewall configuration to protect cardholder data	Firewall rules are used to restrict traffic to nodes. GKE nodes are provisioned as Compute Engine instances and use the same firewall mechanisms as other instances.
1.1 Establish and implement firewall and router configuration standards that include the following:	N/A
1.1.1 A formal process for approving and testing all network connections and changes to the firewall and router configurations	Treat your networking configurations and infrastructure as code. Establish a continuous integration and continuous delivery (CI/CD) pipeline as part of your change-management and change-control processes. Terraform templates are uses as part of the CI/CD pipeline to create network policies on the GKE clusters.
1.1.2 Current network diagram that identifies all connections between the cardholder data environment and other networks, including any wireless networks	Network layout This diagram illustrates the network and subnet details within each project. It documents the data flows between projects and into and out of the CDE boundary.
1.1.3 Current diagram that shows all cardholder data flows across systems and networks.	Encrypted traffic into/out from PCI Boundary This diagram illustrates the encrypted traffic going into and out of the PCI boundary.
1.1.4 Requirements for a firewall at each Internet connection and between any demilitarized zone (DMZ) and the Internal network zone	Segmented using projects and VPC - Service controls, use of a VPC public subnet to simulate a traditional DMZ network zone
1.1.5 Description of groups, roles, and responsibilities for management of network components.	Cloud IAM for authorization to GKE clusters. Kubernetes RBAC grant granular permissions to network policies
1.1.6 Documentation of business justification and approval for use of all services, protocols, and ports allowed, including documentation of security features implemented for those protocols considered to be insecure.	N/A
1.1.7 Requirement to review firewall and router rule sets at least every six months.	N/A

 1.2 Build firewall and router configurations that restrict connections between untrusted networks and any system components in the cardholder data environment. Note: An "untrusted network" is any network that is external to the networks belonging to the entity under review, and/or which is out of the entity's ability to control or manage. 	Firewall rules on Compute Engine instances that run the GKE nodes. Firewall rules protect these cluster nodes. Network policies to restrict flows and protect pods in a cluster. To further segment a cluster, namespaces are leveraged.
1.2.1 Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	Firewall rules and internal load balancers are used to restrict traffic into and out of the in-scope PCI clusters. Authorized networks to restrict (or whitelist) certain IP ranges that can reach a cluster's control plane have been implemented
1.2.2 Secure and synchronize router configuration files.	N/A
1.2.3 Install perimeter firewalls between all wireless networks and the cardholder data environment, and configure these firewalls to deny or, if traffic is necessary for business purposes, permit only authorized traffic between the wireless environment and the cardholder data environment.	N/A
1.3 Prohibit direct public access between the Internet and any system component in the cardholder	
data environment.	N/A
1.3.1 Implement a DMZ to limit inbound traffic to only system components that provide authorized publicly accessible services, protocols, and ports.	Segmented subnets, firewall rules and load balancers limit traffic to specific ports and pods
1.3.2 Limit inbound Internet traffic to IP addresses within the DMZ.	Inbound / Outbound NAT and <u>private clusters</u> for non-public facing clusters to ensure workloads are isolated from public internet
1.3.3 Implement anti-spoofing measures to detect and block forged source IP addresses from entering the network.(For example, block traffic originating from the Internet with an internal source address.)	Inbound / Outbound NAT and <u>private clusters</u> for non-public facing clusters to ensure workloads are isolated from public internet
1.3.4 Do not allow unauthorized outbound traffic from the cardholder data environment to the Internet.	Restricting traffic with inbound/outbound NAT, firewall rules, and VPC-SC
1.3.5 Permit only "established" connections into the network.	Firewall rules are use to restrict inbound and outbound traffic
1.3.6 Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	GKE nodes for in-scope PCI project are in their own subnet which is different from the public load balancer(s)
1.3.7 Do not disclose private IP addresses and routing information to unauthorized parties.	
Note: Methods to obscure IP addressing may include, but are not limited to: Network Address Translation (NAT) Placing servers containing cardholder data behind proxy servers/firewalls or content caches, Removal or filtering of route advertisements for private networks that employ registered addressing,	PEC 1019 address space is used for all PCI pades
Internal use of RFC1918 address space instead of registered addresses.	RFC 1918 address space is used for all PCI nodes

 1.4 Install personal firewall software or equivalent functionality on any portable computing devices (including company and/or employee-owned) that connect to the Internet when outside the network (for example, laptops used by employees), and which are also used to access the CDE. Firewall (or equivalent) configurations include: Specific configuration settings are defined. Personal firewall (or equivalent functionality) is actively running. Personal firewall (or equivalent functionality) is not alterable by users of the portable computing devices. 	N/A
1.5 Ensure that security policies and operational procedures for managing firewalls are documented,	
in use, and known to all affected parties	N/A
Requirement 2: Do not use vendor-supplied defaults for system passwords and other security parameters	
2.1 Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network.	
This applies to ALL default passwords, including but not limited to those used by operating systems, software that provides security services, application and system accounts, point-of-sale (POS) terminals, Simple Network Management Protocol (SNMP) community strings, etc.)	
2.1.1 For wireless environments connected to the cardholder data environment or transmitting cardholder data, change ALL wireless vendor defaults at installation, including but not limited to default wireless encryption keys, passwords, and SNMP community strings.	N/A
2.2 Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute	GKE clusters are hardened per the GKE hardening guide. The recommendations in
National Institute of Standards Technology (NIST)	the hardening guide relate to CIS GKE Benchmark Recommendations
2.2.1 Implement only one primary function per server to prevent functions that require different security levels from co-existing on the same server. (For example, web servers, database servers, and DNS should be implemented on separate servers.)	
Note : Where virtualization technologies are in use, implement only one primary function per virtual system component.	There is 1 service per containers and containers are grouped in specific pods and clusters
2.2.2 Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	COS is being used at the node OS and Pod Security Policies are being used to enable seccomp and apparmor

2.2.3 Implement additional security features for any required services, protocols, or daemons that are considered to be insecure.	
Note: Where SSL/early TLS is used, the requirements in Appendix A2 must be completed.	
	TLS is being used for all traffic in and out of the in-scope VPC
2.2.4 Configure system security parameters to prevent misuse.	A restricted Pod Security Policy requires users to run as an unprivileged user, blocks possible escalations to root, and requires use of several security mechanisms
2.2.5 Remove all unnecessary functionality, such as scripts, drivers, features, subsystems, file systems, and unnecessary web servers.	COS is being used as the OS and the containers only container the necessary code and libraries for their service / function
2.3 Encrypt all non-console administrative access using strong cryptography.	TLS and SSH are being used
2.4 Maintain an inventory of system components that are in scope for PCI DSS.	This can be tracked with Cloud Asset Inventory and Git/SCM history of terraform
2.5 Ensure that security policies and operational procedures for managing vendor defaults and other security parameters are documented, in use, and known to all affected parties	N/A
2.6 Shared hosting providers must protect each entity's hosted environment and cardholder data. These providers must meet specific requirements as detailed in Appendix A1: Additional PCI DSS Requirements for Shared Hosting Providers.	N/A
Requirement 3: Protect stored cardholder data	
3.1 Keep cardholder data storage to a minimum by implementing data retention and disposal policies, procedures and processes that include at least the following for all cardholder data (CHD) storage: • Limiting data storage amount and retention time to that which is required for legal, regulatory, and/or business requirements • Specific retention requirements for cardholder data • Processes for secure deletion of data when no longer needed • A quarterly process for identifying and securely deleting stored cardholder data that exceeds defined retention.	N/A
 3.2 Do not store sensitive authentication data after authorization (even if encrypted). If sensitive authentication data is received, render all data irretrievable upon completion of the authorization process. It is permissible for issuers and companies that support issuing services to store sensitive authentication data if: There is a business justification and The data is stored securely. Sensitive authentication data includes the data as cited in the following Requirements 3.2.1 through 3.2.3: 	N/A

3.2.1 Do not store the full contents of any track (from the magnetic stripe located on the back of a	
card, equivalent data contained on a chip, or elsewhere) after authorization. This data is alternatively	
called full track, track 1, track 2, and magnetic-stripe data.	
Note : In the normal course of business, the following data elements from the magnetic stripe may	
need to be retained:	
• The cardholder's name	
Primary account number (PAN)	
• Expiration date	
• Service code	
To minimize risk, store only these data elements as needed for business.	
To thin in zerisk, store only these data dements as needed for business.	Cloud DLP is used to redact the PAN in the logs
3.2.2 Do not store the card verification code or value (three-digit or four-digit number printed on the	
front or back of a payment card used to verify card-not-present transactions) after authorization.	N/A
3.2.3 Do not store the personal identification number (PIN) or the encrypted PIN block after	
authorization.	N/A
3.3 Mask PAN when displayed (the first six and last four digits are the maximum number of digits to	
be displayed), such that only personnel with a legitimate business need can see more than the first	
six/last four digits of the PAN.	
Six last roun digits of the PAN.	
Note : This requirement does not supersede stricter requirements in place for displays of cardholder	
data—for example, legal or payment card brand requirements for point-of-sale (POS) receipts.	N/A
3.4 Render PAN unreadable anywhere it is stored (including on portable digital media, backup media	
and in logs) by using any of the following approaches:	
One-way hashes based on strong cryptography, (hash must be of the entire PAN)	
• Truncation (hashing cannot be used to replace the truncated segment of PAN)	
• Index tokens and pads (pads must be securely stored)	
Strong cryptography with associated key-management processes and procedures.	
Note : It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they	
have access to both the truncated and hashed version of a PAN. Where hashed and truncated	On Google Cloud, data is encrypted at rest by default. The default encryption is
versions of the same PAN are present in an entity's environment, additional controls must be in place	leveraged in the blueprint.
to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original	In addition, you can use the DLP API to scan, discover, and report the cardholder
PAN.	data.
3.4.1 If disk encryption is used (rather than file- or column-level database encryption), logical access	
must be managed separately and independently of native operating system authentication and	
access control mechanisms (for example, by not using local user account databases or general	
network login credentials). Decryption keys must not be associated with user accounts.	
The two rk rogin of edentials). Deci yption keys must not be associated with user accounts.	
Nate: This requirement applies in addition to all other BCLDSS apprentian and leave recognition	
Note : This requirement applies in addition to all other PCI DSS encryption and key-management requirements.	N/A
	IIWA

3.5 Document and implement procedures to protect keys used to secure stored cardholder data	
against disclosure and misuse:	
Note: This requirement applies to keys used to encrypt stored cardholder data, and also applies to	
key-encrypting keys used to protect data-encrypting keys—such key-encrypting keys must be at	
least as strong as the data-encrypting key.	
	Default Google encryption at rest is used.
3.5.1 Additional requirement for service providers only: Maintain a documented description of the	
cryptographic architecture that includes:	
Details of all algorithms, protocols, and keys used for the protection of cardholder data, including	
key strength and expiry date	
Description of the key usage for each key	l
Inventory of any HSMs and other SCDs used for key management	N/A
3.5.2 Restrict access to cryptographic keys to the fewest number of custodians necessary.	
3.5.3 Store secret and private keys used to encrypt/decrypt cardholder data in one (or more) of the	
following forms at all times:	
• Encrypted with a key-encrypting key that is at least as strong as the data encrypting key, and that is	
stored separately from the data-encrypting key	
• Within a secure cryptographic device (such as a hardware (host) security module (HSM) or PTS-	
approved point-of-interaction device) • As at least two full-length key components or key shares, in accordance with an industry accepted	
method	
metriod	
Note: It is not required that public keys be stored in one of these forms.	Google's default encryption meets this requirement.
3.5.4 Store cryptographic keys in the fewest possible locations.	Google's default encryption meets this requirement.
3.6 Fully document and implement all key-management processes and procedures for	
cryptographic keys used for encryption of cardholder data, including the following:	
Note: Numerous industry standards for key management are available from various resources	
including NIST, which can be found at http://csrc.nist.gov	Google's default encryption meets this requirement.
3.6.1 Generation of strong cryptographic keys	Google's default encryption meets this requirement.
3.6.2 Secure cryptographic key distribution.	Google's default encryption meets this requirement.
3.6.3 Secure cryptographic key storage.	Google's default encryption meets this requirement.
3.6.4 Cryptographic key changes for keys that have reached the end of their crypto period (for	
example, after a defined period of time has passed and/or after a certain amount of cipher-text has	
been produced by a given key), as defined by the associated application vendor or key owner, and	
based on industry best practices and guidelines (for example, NIST Special Publication 800-57).	Google's default encryption meets this requirement.
3.6.5 Retirement or replacement (for example, archiving, destruction, and/or revocation) of keys as	
deemed necessary when the integrity of the key has been weakened (for example, departure of an	
employee with knowledge of a clear-text key component), or keys are suspected of being	
compromised.	
Note: If retired or replaced cryptographic keys need to be retained, these keys must be securely	
archived (for example, by using a key encryption key). Archived cryptographic keys should only be	Coogle's default appropriate monto this requirement
used for decryption/verification purposes.	Google's default encryption meets this requirement.

3.6.6 If manual clear-text cryptographic key-management operations are used, these operations must be managed using split knowledge and dual control.	
Note: Examples of manual key management operations include, but are not limited to: key generation, transmission, loading, storage and	
destruction.	Google's default encryption meets this requirement.
3.6.7 Prevention of unauthorized substitution of cryptographic keys.	Google's default encryption meets this requirement.
3.6.8 Requirement for cryptographic key custodians to formally acknowledge that they understand and accept their key-custodian responsibilities.	Google's default encryption meets this requirement.
3.7 Ensure that security policies and operational procedures for protecting stored cardholder data are documented, in use, and known to all affected parties.	N/A
Requirement 4: Encrypt transmission of cardholder data across open, public networks	
 4.1 Use strong cryptography and security protocols to safeguard sensitive cardholder data during transmission over open, public networks, including the following: Only trusted keys and certificates are accepted. The protocol in use only supports secure versions or configurations. The encryption strength is appropriate for the encryption methodology in use. 	
Note: Where SSL/early TLS is used, the requirements in Appendix A2 must be completed. Examples of open, public networks include but are not limited to: • The Internet • Wireless technologies, including 802.11 and Bluetooth • Cellular technologies, for example, Global System for Mobile communications (GSM), Code division multiple access (CDMA) • General Packet Radio Service (GPRS)	TLS with Frontend Load Balancers is being used. mTLS with Istio is also being used
Satellite communications	for service to service communication.
4.1.1 Ensure wireless networks transmitting cardholder data or connected to the cardholder data environment, use industry best practices to implement strong encryption for authentication and transmission.	N/A
4.2 Never send unprotected PANs by enduser messaging technologies (for example, email, instant messaging, SMS, chat, etc.).	N/A
4.3 Ensure that security policies and operational procedures for encrypting transmissions of cardholder data are documented, in use, and known to all affected parties.	N/A
Requirement 5: Protect all systems against malware and regularly update anti-virus software or programs	
5.1 Deploy anti-virus software on all systems commonly affected by malicious software (particularly personal computers and servers).	N/A
5.1.1 Ensure that all anti-virus programs are capable of detecting, removing, and protecting against all known types of malicious software.	N/A
5.1.2 For systems considered to be not commonly affected by malicious software, perform periodic evaluations to identify and evaluate evolving malware threats in order to confirm whether such systems continue to not require anti-virus software.	N/A
<u>'</u>	1

5.2 Ensure that all anti-virus mechanisms are maintained as follows:	
Are kept current,	
Perform periodic scans	
Generate audit logs which are retained per PCI DSS Requirement 10.7	N/A
5.3 Ensure that anti-virus mechanisms are actively running and cannot be disabled or altered by	
users, unless specifically authorized by management on a case-by-case basis for a limited time	
period.	
Note: Anti-virus solutions may be temporarily disabled only if there is legitimate technical need, as	
authorized by management on a case-by-case basis. If anti-virus protection needs to be disabled for	
a specific purpose, it must be formally authorized. Additional security measures may also need to be	
implemented for the period of time during which anti-virus protection is not active.	N/A
5.4 Ensure that security policies and operational procedures for protecting systems against malware	
are documented, in use, and known to all affected parties.	N/A
·	IVA
Requirement 6: Develop and maintain secure systems and applications	
6.1 Establish a process to identify security vulnerabilities, using reputable outside sources for	
security vulnerability information, and assign a risk ranking (for example, as "high," "medium," or	
"low") to newly discovered security vulnerabilities.	
Note: Risk rankings should be based on industry best practices as well as consideration of potential	
impact. For example, criteria for ranking vulnerabilities may include consideration of the CVSS base	
score, and/or the classification by the vendor, and/or type of systems affected.	
Methods for evaluating vulnerabilities and assigning risk ratings will vary based on an organization's	
environment and risk assessment strategy. Risk rankings should, at a minimum, identify all	
vulnerabilities considered to be a "high risk" to the environment. In addition to the risk ranking,	
vulnerabilities may be considered "critical" if they pose an imminent threat to the environment,	
impact critical systems, and/or would result in a potential compromise if not addressed. Examples of	
critical systems may include security systems, public-facing devices and systems, databases, and	Container Analysis vulnerbility scanning can be used to scan container images and
other systems that store, process, or transmit cardholder data.	assign a rating based on CVEs.
6.2 Ensure that all system components and software are protected from known vulnerabilities by	
installing applicable vendor supplied security patches. Install critical security patches within one	
month of release.	
Note: Critical security patches should be identified according to the risk ranking process defined in	COS is being used at the node OS. Node auto-upgrades is used to ensure nodes in
Requirement 6.1.	the cluster are up to date with the cluster
6.3 Develop internal and external software applications (including web-based administrative access	·
to applications) securely, as follows:	
In accordance with PCI DSS (for example, secure authentication and logging) • In accordance with PCI DSS (for example, secure authentication and logging)	
:	
Based on industry standards and/or best practices. Incorporating information sequrity throughout the software development life evolutions.	
• Incorporating information security throughout the software-development life cycle	
Note : this applies to all software developed internally as well as bespoke or custom software	Binary Authorization can be used to ensure that only trusted containers are
developed by a third party.	deployed to GKE. Currently not implemented
developed by a till a party.	deployed to One. Cult entry not implemented

	T
6.3.1 Remove development, test and/or custom application accounts, user IDs, and passwords	N/A
before applications become active or are released to customers.	N/A
6.3.2 Review custom code prior to release to production or customers in order to identify any potential coding vulnerability (using either manual or automated processes) to include at least the	
following:	
Code changes are reviewed by individuals other than the originating code author, and by	
individuals knowledgeable about code-review techniques and secure coding practices.	
Code reviews ensure code is developed according to secure coding guidelines	
Appropriate corrections are implemented prior to release. Code as a inverse the are regioned and appropriate by respect to rich to release.	
Code-review results are reviewed and approved by management prior to release	
Note: This requirement for code reviews applies to all custom code (both internal and public-facing),	
as part of the system development life cycle. Code reviews can be conducted by knowledgeable	
internal personnel or third parties. Public-facing web applications are also subject to additional	
controls, to address ongoing threats and vulnerabilities after implementation, as defined at PCI DSS	
Requirement 6.6.	N/A
6.4 Follow change control processes and procedures for all changes to system components. The processes must include the following:	
6.4.1 Separate development/test environments from production environments, and enforce the separation with access controls.	You can enforce seperation of development / test environment from production environment by projects and folders. Access can be controlled to those projects
	via GCP IAM
6.4.2 Separation of duties between development/test and production environment.	Seperation of duties between development / test environment from production environment can be enforced via GCP IAM
6.4.3 Production data (live PANs) are not used for testing or development.	N/A
6.4.4 Removal of test data and accounts from system components before the system becomes	
active / goes into production.	N/A
6.4.5 Change control procedures must include the following:	N/A
6.4.5.1 Documentation of impact.	N/A
6.4.5.2 Documented change approval by authorized parties.	N/A
6.4.5.3 Functionality testing to verify that the change does not adversely impact the security of the	
system.	N/A
6.4.5.4 Back-out procedures.	N/A
6.4.6 Upon completion of a significant change, all relevant PCI DSS requirements must be	
implemented on all new or changed systems and networks, and documentation updated as	
applicable.	N/A
6.5 Address common coding vulnerabilities in software-development processes as follows:	
• Train developers at least annually in up-to-date secure coding techniques, including how to avoid	
common coding vulnerabilities. • Develop applications based on secure coding guidelines.	
- Develop applications based on secure coding guidelines.	
Note : The vulnerabilities listed at 6.5.1 through 6.5.10 were current with industry best practices when	
this version of PCI DSS was published. However, as industry best practices for vulnerability	
management are updated (for example, the OWASP Guide, SANS CWE Top 25, CERT Secure Coding,	
etc.), the current best practices must be used for these requirements.	N/A

6.5.1 Injection flaws, particularly SQL injection. Also consider OS Command Injection, LDAP and	
XpPath injection flaws as well as other injection flaws.	N/A
6.5.2 Buffer overflows.	N/A
6.5.3 Insecure cryptographic storage.	N/A
6.5.4 Insecure communications.	N/A
6.5.5 Improper error handling.	N/A
6.5.6 All "high risk" vulnerabilities identified in the vulnerability identification process (as defined in PCI DSS Requirement 6.1).	N/A
Note: Requirements 6.5.7 through 6.5.9, below, apply to web applications and application interfaces (internal or external):	
6.5.7 Cross-site scripting (XSS).	N/A
6.5.8 Improper Access Control (such as insecure direct object references, failure to restrict URL access, directory traversal and failure to restrict user access to functions).	N/A
6.5.9 Cross-site request forgery (CRSF).	N/A
6.5.10 Broken authentication and session management.	N/A
 6.6 For public-facing web applications, address new threats and vulnerabilities on an ongoing basis and ensure these applications are protected against known attacks by either of the following methods: Reviewing public-facing web applications via manual or automated application vulnerability 	
Note: This assessment is not the same as the vulnerability scans performed for Requirement 11.2. Installing an automated technical solution that detects and prevents web based attacks (for example, a web application firewall) in front of public facing web applications, to continually check all traffic.	Web Security Scanner allows you to scan publicly facing App Engine, Compute Engine, and GKE web applications for common vulnerabilities ranging from cross-site scripting and misconfigurations to vulnerable resources. Cloud Armor can be be used to as a WAF to detect application level vulnerabilities.
6.7 Ensure that security policies and operational procedures for developing and maintaining secure systems and applications are documented, in use, and known to all affected parties.	N/A
Requirement 7: Restrict access to cardholder data by business need to know	
7.1 Limit access to system components and cardholder data to only those individuals whose job requires such access.	Cloud IAM and RBAC are being used provde fine-grained access control.
 7.1.1 Define access needs for each role, including: System components and data resources that each role needs to access for their job function Level of privilege required (for example, user, administrator, etc.) for accessing resources 	N/A
7.1.2 Restrict access to privileged user IDs to least privileges necessary to perform job responsibilities.	A pod security policy is being used to make sure containers / services are not being ran as root.
7.1.3 Assign access based on individual personnel's job classification and function	N/A
7.1.4 Require documented approval by authorized parties specifying required privileges.	N/A

7.2 Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s)	
must include the following:	N/A
7.2.1 Coverage of all system components.	N/A
7.2.2 Assignment of privileges to individuals based on job classification and function.	N/A
7.2.3 Default "deny-all" setting.	N/A
7.3 Ensure that security policies and operational procedures for restricting access to cardholder data are documented, in use, and known to all affected parties.	N/A
Requirement 8: Identify and authenticate access to system components	
8.1 Define and implement policies and procedures to ensure proper user identification management for nonconsumer users and administrators on all system components as follows:	N/A
8.1.1 Assign all users a unique ID before allowing them to access system components or cardholder data.	N/A
8.1.2 Control addition, deletion, and modification of user IDs, credentials, and other identifier objects.	N/A
8.1.3 Immediately revoke access for any terminated users.	N/A
8.1.4 Remove/disable inactive user accounts within 90 days.	N/A
 8.1.5 Manage IDs used by third parties to access, support, or maintain system components via remote access as follows: Enabled only during the time period needed and disabled when not in use. Monitored when in use. 	N/A
8.1.6 Limit repeated access attempts by locking out the user ID after not more than six attempts.	N/A
8.1.7 Set the lockout duration to a minimum of 30 minutes or until an administrator enables the user ID.	N/A
8.1.8 If a session has been idle for more than 15 minutes, require the user to re-authenticate to reactivate the terminal or session.	N/A
 8.2 In addition to assigning a unique ID, ensure proper user-authentication management for non-consumer users and administrators on all system components by employing at least one of the following methods to authenticate all users: Something you know, such as a password or passphrase Something you have, such as a token device or smart card Something you are, such as a biometric. 	Certificates are bound to a user's identity when they authenticate to kubectl. All GKE clusters are configured to accept Google Cloud user and service account identities, by validating the credentials and retrieving the email address associated with the user or service account identity.
8.2.1 Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system component.	N/A
8.2.2 Verify user identity before modifying any authentication credential—for example, performing password resets, provisioning new tokens, or generating new keys.	N/A
8.2.3 Passwords/phrases must meet the following: Require a minimum length of at least seven characters. Contain both numeric and alphabetic characters.	
Alternatively, the passwords/phrases must have complexity and strength at least equivalent to the parameters specified above.	N/A

8.2.4 Change user passwords/passphrases at least every 90 days.	N/A
8.2.5 Do not allow an individual to submit a new password/phrase that is the same as any of the last	
four passwords/phrases he or she has used.	N/A
8.2.6 Set passwords/phrases for first time use and upon reset to a unique value for each user, and	
change immediately after the first use.	N/A
8.3 Secure all individual non-console administrative access and all remote access to the CDE using	
multi-factor authentication.	
Note : Multi-factor authentication requires that a minimum of two of the three authentication	
methods (see Requirement 8.2 for descriptions of authentication methods) be used for	
authentication. Using one factor twice (for example, using two separate passwords) is not considered multi-factor authentication.	
considered multi-factor authentication.	N/A
8.3.1 Incorporate multi-factor authentication for all non-console access into the CDE for personnel	
with administrative access.	N/A
8.3.2 Incorporate multi-factor authentication for all remote network access (both user and	
administrator, and including third-party access for support or maintenance) originating from outside	N/A
the entity's network.	N/A
8.4 Document and communicate authentication policies and procedures to all users including:Guidance on selecting strong authentication credentials	
Guidance for how users should protect their authentication credentials	
• Instructions not to reuse previously used passwords	
• Instructions to change passwords if there is any suspicion the password could be compromised.	N/A
8.5 Do not use group, shared, or generic IDs, passwords, or other authentication methods as follows:	
Generic user IDs are disabled or removed.	
Shared user IDs do not exist for system administration and other critical functions.	
• Shared and generic user IDs are not used to administer any system components	N/A
8.5.1 Additional requirement for service providers only: Service providers with remote access to	
customer premises (for example, for support of POS systems or servers) must use a unique	
authentication credential (such as a password/phrase) for each customer.	
Note: This requirement is not intended to apply to shared hosting providers accessing their own	
hosting environment, where multiple customer environments are hosted.	N/A
8.6 Where other authentication mechanisms are used (for example, physical or logical security	
tokens, smart cards, certificates, etc.), use of these mechanisms must be assigned as follows:	
Authentication mechanisms must be assigned to an individual account and not shared among	
multiple accounts.	
• Physical and/or logical controls must be in place to ensure only the intended account can use that	
mechanism to gain access	N/A

8.7 All access to any database containing cardholder data (including access by applications, administrators, and all other users) is restricted as follows:	
 All user access to, user queries of, and user actions on databases are through programmatic methods. Only database administrators have the ability to directly access or query databases. 	
• Application IDs for database applications can only be used by the applications (and not by individual users or other non-application processes)	N/A
8.8 Ensure that security policies and operational procedures for identification and authentication are documented, in use, and known to all affected parties.	N/A
Requirement 9: Restrict physical access to cardholder data	Google is responsible for physical security controls on all Google data centers underlying GCP.
9.1 Use appropriate facility entry controls to limit and monitor physical access to systems in the cardholder data environment.	N/A
9.1.1 Use either video cameras or access control mechanisms (or both) to monitor individual physical access to sensitive areas. Review collected data and correlate with other entries. Store for at least three months, unless otherwise restricted by law.	
Note : "Sensitive areas" refers to any data center, server room or any area that houses systems that store, process, or transmit cardholder data. This excludes public-facing areas where only point-of-sale terminals are present, such as the cashier areas in a retail store.	N/A
9.1.2 Implement physical and/or logical controls to restrict access to publicly accessible network jacks.	
For example, network jacks located in public areas and areas accessible to visitors could be disabled and only enabled when network access is explicitly authorized. Alternatively, processes could be implemented to ensure that visitors are escorted at all times in areas with active network jacks.	N/A
9.1.3 Restrict physical access to wireless access points, gateways, handheld devices, networking/communications hardware, and telecommunications lines.	N/A
 9.2 Develop procedures to easily distinguish between onsite personnel and visitors, to include: Identifying onsite personnel and visitors (for example, assigning badges) Changes to access requirements Revoking or terminating onsite personnel and expired visitor identification (such as ID badges). 	N/A
9.3 Control physical access for onsite personnel to the sensitive areas as follows: • Access must be authorized and based on individual job function. • Access is revoked immediately upon termination, and all physical access mechanisms, such as keys, access cards, etc., are returned or disabled	
9.4 Implement procedures to identify and authorize visitors. Procedures should include the following:	N/A
9.4.1 Visitors are authorized before entering, and escorted at all times within, areas where cardholder data is processed or maintained.	N/A
9.4.2 Visitors are identified and given a badge or other identification that expires and that visibly distinguishes the visitors from onsite personnel.	N/A

	I
9.4.3 Visitors are asked to surrender the badge or identification before leaving the facility or at the date of expiration.	N/A
9.4.4 A visitor log is used to maintain a physical audit trail of visitor activity to the facility as well as computer rooms and data centers where cardholder data is stored or transmitted. Document the visitor's name, the firm represented, and the onsite personnel authorizing physical access on the log. Retain this log for a minimum of three months, unless otherwise restricted by law.	N/A
9.5 Physically secure all media.	N/A
9.5.1 Store media backups in a secure location, preferably an off-site facility, such as an alternate or backup site, or a commercial storage facility. Review the location's security at least annually.	N/A
9.6 Maintain strict control over the internal or external distribution of any kind of media, including the following:	N/A
9.6.1 Classify media so the sensitivity of the data can be determined.	N/A
9.6.2 Send the media by secured courier or other delivery method that can be accurately tracked.	N/A
9.6.3 Ensure management approves any and all media that is moved from a secured area (including when media is distributed to individuals).	N/A
9.7 Maintain strict control over the storage and accessibility of media.	N/A
9.7.1 Properly maintain inventory logs of all media and conduct media inventories at least annually.	N/A
9.8 Destroy media when it is no longer needed for business or legal reasons as follows:	N/A
9.8.1 Shred, incinerate, or pulp hardcopy materials so that cardholder data cannot be reconstructed. Secure storage containers used for materials that are to be destroyed.	N/A
9.8.2 Render cardholder data on electronic media unrecoverable so that cardholder data cannot be reconstructed.	N/A
9.9 Protect devices that capture payment card data via direct physical interaction with the card from tampering and substitution.	
Note: These requirements apply to card reading devices used in card-present transactions (that is, card swipe or dip) at the point of sale. This requirement is not intended to apply to manual key-entry components such as computer keyboards and POS keypads.	N/A
9.9.1 Maintain an up-to-date list of devices. The list should include the following:	
 Make, model of device Location of device (for example, the address of the site or facility where the device is located) Device serial number or other method of unique identification 	N/A
9.9.2 Periodically inspect device surfaces to detect tampering (for example, addition of card skimmers to devices), or substitution (for example, by checking the serial number or other device characteristics to verify it has not been swapped with a fraudulent device).	
Note : Examples of signs that a device might have been tampered with or substituted include unexpected attachments or cables plugged into the device, missing or changed security labels, broken or differently colored casing, or changes to the serial number or other external markings.	N/A

audit I have k useful creatii GKE c Audit	
to granting them access to modify or troubleshoot devices. • Do not install, replace, or return devices without verification. • Be aware of suspicious behavior around devices (for example, attempts by unknown persons to unplug or open devices). • Report suspicious behavior and indications of device tampering or substitution to appropriate personnel (for example, to a manager or security officer) 9.10 Ensure that security policies and operational procedures for restricting physical access to cardholder data are documented, in use, and known to all affected parties. Requirement 10: Track and monitor all access to network resources and cardholder data N/A 10.1 Implement audit trails to link all access to system components to each individual user. GKE of Audit audit I have be useful creating.	dit logs and Stackdriver are being used. Kubernetes clusters have Kubernetes lit logging enabled by default, which keeps a chronological record of calls that e been made to the Kubernetes API server. Kubernetes audit log entries are ful for investigating suspicious API requests, for collecting statistics, or for ating monitoring alerts for unwanted API calls.
cardholder data are documented, in use, and known to all affected parties. Requirement 10: Track and monitor all access to network resources and cardholder data N/A 10.1 Implement audit trails to link all access to system components to each individual user. Audit audit I have to useful creating GKE of Audit audit I have to useful creating GKE of Audit I have to a component to the component to the component to each individual user.	dit logs and Stackdriver are being used. Kubernetes clusters have Kubernetes lit logging enabled by default, which keeps a chronological record of calls that e been made to the Kubernetes API server. Kubernetes audit log entries are ful for investigating suspicious API requests, for collecting statistics, or for ating monitoring alerts for unwanted API calls.
10.1 Implement audit trails to link all access to system components to each individual user. Audit laudit I have buseful creati GKE conductions and the system components to each individual user.	dit logs and Stackdriver are being used. Kubernetes clusters have Kubernetes lit logging enabled by default, which keeps a chronological record of calls that e been made to the Kubernetes API server. Kubernetes audit log entries are ful for investigating suspicious API requests, for collecting statistics, or for ating monitoring alerts for unwanted API calls.
audit I have k useful creatii GKE c Audit	lit logging enabled by default, which keeps a chronological record of calls that e been made to the Kubernetes API server. Kubernetes audit log entries are ful for investigating suspicious API requests, for collecting statistics, or for ating monitoring alerts for unwanted API calls.
Audit	E clusters integrate a default configuration for GKE audit logging with Cloud
	lit Logs and Logging. You can see Kubernetes audit log entries in your Google ud project.
	ddition to entries written by Kubernetes, your project's audit logs have entries tten by GKE.
labels	differentiate your CDE and non-CDE workloads, we recommend that you add els to your GKE pods that will percolate into metrics and logs emitted from se workloads.
10.2 Implement automated audit trails for all system components to reconstruct the following events:	dit logs and Stackdriver are being used.
	dit logs and Stackdriver are being used.
	lit logs and Stackdriver are being used.
	dit logs and Stackdriver are being used.
	dit logs and Stackdriver are being used.
10.2 5 Use of and changes to identification and authentication mechanisms—including but not limited to creation of new accounts and elevation of privileges—and all changes, additions, or deletions to accounts with root or administrative privileges. N/A	
10.2.6 Initialization, stopping, or pausing of the audit logs N/A	
10.2.7 Creation and deletion of system level objects N/A	
10.3 Record at least the following audit trail entries for all system components for each event:	dit logs and Stackdriver are being used
	lit logs and Stackdriver are being used

10.3.2 Type of event.	Audit logs and Stackdriver are being used
10.3.3 Date and time.	Audit logs and Stackdriver are being used
10.3.4 Success or failure indication.	Audit logs and Stackdriver are being used
10.3.5 Origination of event.	Audit logs and Stackdriver are being used
10.3.6 Identity or name of affected data, system component, or resource.	Audit logs and Stackdriver are being used
10.4 Using time-synchronization technology, synchronize all critical system clocks and times and ensure that the following is implemented for acquiring, distributing, and storing time.	
Note : One example of time synchronization technology is Network Time Protocol (NTP).	Google NTP servers are being used
10.4.1 Critical systems have the correct and consistent time.	Google NTP servers are being used
10.4.2 Time data is protected.	Google NTP servers are being used
10.4.3 Time settings are received from industry-accepted time sources.	Google NTP servers are being used
10.5 Secure audit trails so they cannot be altered.	Logs are in their own project, which could be restricted
10.5.1 Limit viewing of audit trails to those with a job-related need.	N/A
10.5.2 Protect audit trail files from unauthorized modifications.	N/A
10.5.3 Promptly back up audit trail files to a centralized log server or media that is difficult to alter.	N/A
10.5.4 Write logs for external-facing technologies onto a secure, centralized, internal log server or media device.	Logs are in their own project and storage buckets
10.5.5 Use file integrity monitoring or change-detection software on logs to ensure that existing log data cannot be changed without generating alerts (although new data being added should not cause an alert).	N/A
10.6 Review logs and security events for all system components to identify anomalies or suspicious activity.	
Note: Log harvesting, parsing, and alerting tools may be used to meet this Requirement.	N/A
 10.6.1 Review the following at least daily: All security events Logs of all system components that store, process, or transmit CHD and/or SAD Logs of all critical system components Logs of all servers and system components that perform security functions (for example, firewalls, intrusion-detection systems/intrusion-prevention systems (IDS/IPS), authentication servers, ecommerce redirection servers, etc.). 	N/A
10.6.2 Review logs of all other system components periodically based on the organization's policies and risk management strategy, as determined by the organization's annual risk assessment.	N/A
10.6.3 Follow up exceptions and anomalies identified during the review process.	N/A
10.7 Retain audit trail history for at least one year, with a minimum of three months immediately available for analysis (for example, online, archived, or restorable from backup).	N/A

10.8 Additional requirement for service providers only: Implement a process for the timely	
detection and reporting of failures of critical security control systems, including but not limited to	
failure of:	
• Firewalls	
• IDS/IPS	
• FIM	
Anti-virus	
Physical access controls	
Logical access controls	
Audit logging mechanisms	
Segmentation controls (if used)	N/A
10.8.1 Additional requirement for service providers only: Respond to failures of any critical	
security controls in a timely manner. Processes for responding to failures in security controls must	
include:	
Restoring security functions	
Identifying and documenting the duration (date and time start to end) of the security failure	
Identifying and documenting cause(s) of failure, including root cause, and documenting	
remediation required to address root cause	
Identifying and addressing any security issues that arose during the failure	
Performing a risk assessment to determine whether further actions are required as a result of the	
security failure	
Implementing controls to prevent cause of failure from reoccurring	
Resuming monitoring of security controls	N/A
10.9 Ensure that security policies and operational procedures for monitoring all access to network	
resources and cardholder data are documented, in use, and known to all affected parties.	N/A
Requirement 11: Regularly test security systems and processes	N/A
11.1 Implement processes to test for the presence of wireless access points (802.11), and detect and	
identify all authorized and unauthorized wireless access points on a quarterly basis.	
Note : Methods that may be used in the process include but are not limited to wireless network	
scans, physical/logical inspections of system components and infrastructure, network access control	
(NAC), or wireless IDS/IPS. Whichever methods are used, they must be sufficient to detect and	
identify both authorized and unauthorized devices.	N/A
11.1.1 Maintain an inventory of authorized wireless access points including a documented business	
justification.	N/A
11.1.2 Implement incident response procedures in the event unauthorized wireless access points are	
detected.	N/A

11.2 Run internal and external network vulnerability scans at least quarterly and after any significant change in the network (such as new system component installations, changes in network topology, firewall rule modifications, product upgrades).	
Note: Multiple scan reports can be combined for the quarterly scan process to show that all systems were scanned and all applicable vulnerabilities have been addressed. Additional documentation may be required to verify non-remediated vulnerabilities are in the process of being addressed. For initial PCI DSS compliance, it is not required that four quarters of passing scans be completed if the assessor verifies 1) the most recent scan result was a passing scan, 2) the entity has documented policies and procedures requiring quarterly scanning, and 3) vulnerabilities noted in the scan results have been corrected as shown in a re-scan(s). For subsequent years after the initial PCI DSS review, four quarters of passing scans must have occurred.	N/A
11.2.1 Perform quarterly internal vulnerability scans. Address vulnerabilities and perform rescans to verify all "high risk" vulnerabilities are resolved in accordance with the entity's vulnerability ranking (per Requirement 6.1). Scans must be performed by qualified personnel.	N/A
11.2.2 Perform quarterly external vulnerability scans, via an Approved Scanning Vendor (ASV) approved by the Payment Card Industry Security Standards Council (PCI SSC). Perform rescans as needed, until passing scans are achieved.	
Note: Quarterly external vulnerability scans must be performed by an Approved Scanning Vendor (ASV), approved by the Payment Card Industry Security Standards Council (PCI SSC). Refer to the ASV Program Guide published on the PCI SSC website for scan customer responsibilities, scan preparation, etc.	N/A
11.2.3 Perform internal and external scans, and rescans as needed, after any significant change. Scans must be performed by qualified personnel.	N/A
 11.3 Implement a methodology for penetration testing that includes the following: Is based on industry-accepted penetration testing approaches (for example, NIST SP800-115) Includes coverage for the entire CDE perimeter and critical systems Includes testing from both inside and outside the network Includes testing to validate any segmentation and scope-reduction controls Defines application-layer penetration tests to include, at a minimum, the vulnerabilities listed in Requirement 6.5 Defines network-layer penetration tests to include components that support network functions as well as operating systems Includes review and consideration of threats and vulnerabilities experienced in the last 12 months Specifies retention of penetration testing results and remediation activities results. 	N/A
11.3.1 Perform external penetration testing at least annually and after any significant infrastructure or application upgrade or modification (such as an operating system upgrade, a sub-network added to the environment, or a web server added to the environment).	N/A
11.3.2 Perform internal penetration testing at least annually and after any significant infrastructure or application upgrade or modification (such as an operating system upgrade, a sub-network added to the environment, or a web server added to the environment)	N/A
11.3.3 Exploitable vulnerabilities found during penetration testing are corrected and testing is repeated to verify the corrections.	N/A

11.3.4 If segmentation is used to isolate the CDE from other networks, perform penetration tests at	
least annually and after any changes to segmentation controls/methods to verify that the	
segmentation methods are operational and effective, and isolate all out-of-scope systems from	l
systems in the CDE.	N/A
11.3.4.1 Additional requirement for service providers only: If segmentation is used, confirm PCI	
DSS scope by performing penetration testing on segmentation controls at least every six months	
and after any changes to segmentation controls/methods.	N/A
11.4 Use intrusion-detection and/or intrusion-prevention techniques to detect and/or prevent	
intrusions into the network.	
Monitor all traffic at the perimeter of the cardholder data environment as well as at critical points in	
the cardholder data environment, and alert personnel to suspected compromises. Keep all	
intrusion-detection and prevention engines, baselines, and signatures up to date.	N/A
11.5 Deploy a change-detection mechanism (for example, file-integrity monitoring tools) to alert	
personnel to unauthorized modification of critical system files, configuration files, or content files;	
and configure the software to perform critical file comparisons at least weekly.	
and defining and and definition of the definitio	
Note: For change-detection purposes, critical files are usually those that do not regularly change,	
but the modification of which could indicate a system compromise or risk of compromise. Change-	
detection mechanisms such as file-integrity monitoring products usually come preconfigured with	
critical files for the related	
operating system. Other critical files, such as those for custom applications, must be evaluated and	
defined by the entity (that is,	
the merchant or service provider)	N/A
11.5.1 Implement a process to respond to any alerts generated by the change detection solution.	N/A
11.6 Ensure that security policies and operational procedures for security monitoring and testing are	
documented, in use, and known to all affected parties.	N/A
	More information about requirement 12 can be found in the GCP PCI Shared
Requirement 12: Maintain a policy that addresses information security for all personnel	Responsibility Matrix
12.1 Establish, publish, maintain, and disseminate a security policy.	N/A
12.1.1 Review the security policy at least annually and update the policy when the environment	
changes.	N/A
12.2 Implement a risk-assessment process that:	
12.2 implement a non assessment process that.	
• Is performed at least annually and upon significant changes to the environment (for example,	
acquisition, merger, relocation, etc.),	
• Identifies critical assets, threats, and vulnerabilities, and	
Results in a formal, documented analysis of risk.	
Results in a formal, accumented unarysis of hora	
Examples of risk-assessment methodologies include but are not limited to OCTAVE, ISO 27005 and	
NIST SP 800-30	N/A
	1

12.3 Develop usage policies for critical technologies and define proper use of these technologies.	
Note: Examples of critical technologies include, but are not limited to, remote access and wireless	
technologies, laptops, tablets, removable electronic media, email usage and Internet usage.	
Ensure these usage policies require the following:	N/A
12.3.1 Explicit approval by authorized parties	N/A
12.3.2 Authentication for use of the technology.	N/A
12.3.3 A list of all such devices and personnel with access.	N/A
12.3.4 A method to accurately and readily determine owner, contact information, and purpose (for	IN/A
example, labeling, coding, and/or inventorying of devices.	N/A
12.3.5 Acceptable uses of the technology.	N/A
12.3.6 Acceptable network locations for the technologies.	N/A
12.3.7 List of company-approved products.	N/A
12.3.8 Automatic disconnect of sessions for remote-access technologies after a specific period of	
inactivity.	N/A
12.3.9 Activation of remote-access technologies for vendors and business partners only when needed by vendors and business partners, with immediate deactivation after use.	N/A
12.3.10 For personnel accessing cardholder data via remote-access technologies, prohibit the	
copying, moving, and storage of cardholder data onto local hard drives and removable electronic	
media, unless explicitly authorized for a defined business need.	
Where there is an authorized business need, the usage policies must require the data be protected in	
accordance with all applicable PCI DSS Requirements.	N/A
12.4 Ensure that the security policy and procedures clearly define information security	
responsibilities for all personnel.	N/A
12.4.1 Additional requirement for service providers only: Executive management shall establish	
responsibility for the protection of cardholder data and a PCI DSS compliance program to include:	
Overall accountability for maintaining PCI DSS compliance Defining a charter for a PCI DSS compliance program and communication to executive	
management	N/A
12.5 Assign to an individual or team the following information security management responsibilities:	N/A
12.5.1 Establish, document, and distribute security policies and procedures.	N/A
12.5.2 Monitor and analyze security alerts and information, and distribute to appropriate personnel.	N/A
12.5.3 Establish, document, and distribute security incident response and escalation procedures to	
ensure timely and effective handling of all situations.	N/A
12.5.4 Administer user accounts, including additions, deletions, and modifications.	N/A
12.5.5 Monitor and control all access to data.	N/A
12.6 Implement a formal security awareness program to make all personnel aware of the cardholder	
data security policy and procedures.	N/A

12.6.1 Educate personnel upon hire and at least annually.	
Note : Methods can vary depending on the role of the personnel and their level of access to the cardholder data.	N/A
12.6.2 Require personnel to acknowledge at least annually that they have read and understood the security policy and procedures.	N/A
12.7 Screen potential personnel prior to hire to minimize the risk of attacks from internal sources. (Examples of background checks include previous employment history, criminal record, credit history and reference checks.)	
Note: For those potential personnel to be hired for certain positions such as store cashiers who only have access to one card number at a time when facilitating a transaction, this requirement is a recommendation only.	N/A
12.8 Maintain and implement policies and procedures to manage service providers with whom cardholder data is shared, or that could affect the security of cardholder data, as follows:	N/A
12.8.1 Maintain a list of service providers including a description of the service provided.	N/A
12.8.2 Maintain a written agreement that includes an acknowledgement that the service providers are responsible for the security of cardholder data the service providers possess or otherwise store, process or transmit on behalf of the customer, or to the extent that they could impact the security of the customer's cardholder data environment.	
Note: The exact wording of an acknowledgement will depend on the agreement between the two parties, the details of the service being provided, and the responsibilities assigned to each party. The acknowledgement does not have to include the exact wording provided in this requirement.	N/A
12.8.3 Ensure there is an established process for engaging service providers including proper due diligence prior to engagement.	N/A
12.8.4 Maintain a program to monitor service providers' PCI DSS compliance status at least annually.	N/A
12.8.5 Maintain information about which PCI DSS requirements are managed by each service provider, and which are managed by the entity.	N/A
12.9 Additional requirement for service providers only : Service providers acknowledge in writing to customers that they are responsible for the security of cardholder data the service provider possesses or otherwise stores, processes, or transmits on behalf of the customer, or to the extent that they could impact the security of the customer's cardholder data environment.	
Note: The exact wording of an acknowledgement will depend on the agreement between the two parties, the details of the service being provided, and the responsibilities assigned to each party. The acknowledgement does not have to include the exact wording provided in this requirement.	N/A
12.10 Implement an incident response plan. Be prepared to respond immediately to a system breach.	N/A

12.10.1 Create the incident response plan to be implemented in the event of system breach. Ensure the plan addresses the following at a minimum. § Roles, responsibilities and communication and contact strategies in the event of a compromise including notification of the payment brands, at a minimum. § Specific incident response procedures. § Business recovery and continuity procedures. § Data back-up processes. § Adaylss of legal requirements for reporting compromises. § Coverage and responses of all critical system components. § Roles revenge and responses of all critical system components. § Roles revenge and responses of all critical system components. § Roles revenge and responses of all critical system components. § Roles revenge and responses of all critical system components. § Roles revenge and responses of all critical system components. § Roles revenge and responses of all critical system components. § Roles revenge and testing the plan, including all elements listed in Requirement 12.10.1 at least annually. 	A1.1 Ensure that each entity only runs processes that have access to that entity's cardholder data	
A.1.2 Restrict each entity's access and privileges to its own cardholder data environment only. N/A	environment.	N/A
	A.1.2 Restrict each entity's access and privileges to its own cardholder data environment only.	N/A

A.1.3 Ensure logging and audit trails are enabled and unique to each entity's cardholder data environment and consistent with PCI DSS Requirement 10.	N/A
A.1.4 Enable processes to provide for timely forensic investigation in the event of a compromise to any hosted merchant or service provider.	N/A
Appendix A2: Additional PCI DSS Requirements for Entities using SSL/early TLS	N/A
A2.1 Where POS POI terminals (and the SSL/TLS termination points to which they connect) use SSL and/or early TLS, the entity must either:	
Confirm the devices are not susceptible to any known exploits for those protocols. Or:	
Have a formal Risk Mitigation and Migration Plan in place.	N/A
A2.2 Entities with existing implementations (other than as allowed in A2.1) that use SSL and/or early TLS must have a formal Risk Mitigation and Migration Plan in place.	N/A
A2.3 Additional Requirement for Service Providers Only: All service providers must provide a secure service offering by June 30, 2016.	
Note : Prior to June 30, 2016, the service provider must either have a secure protocol option included in their service offering, or have a documented Risk Mitigation and Migration Plan (per A2.2) that includes a target date for provision of a secure protocol option no later than June 30, 2016. After this date, all service providers must offer a secure protocol option for their service.	
Appendix A3: Designated Entities Supplemental Validation (DESV)	N/A
A3.1 Implement a PCI DSS compliance program	N/A
A3.1.1 Executive management shall establish responsibility for the protection of cardholder data and a PCI DSS compliance program to include:	
Overall accountability for maintaining PCI DSS compliance Defining a charter for a PCI DSS compliance program	
Providing updates to executive management and board of directors on PCI DSS compliance initiatives and issues, including remediation activities, at least annually	
Providing updates to executive management and board of directors on PCI DSS compliance	N/A
Providing updates to executive management and board of directors on PCI DSS compliance initiatives and issues, including remediation activities, at least annually	N/A
Providing updates to executive management and board of directors on PCI DSS compliance initiatives and issues, including remediation activities, at least annually PCI DSS Reference: Requirement 12	N/A
 Providing updates to executive management and board of directors on PCI DSS compliance initiatives and issues, including remediation activities, at least annually PCI DSS Reference: Requirement 12 A3.1.2 A formal PCI DSS compliance program must be in place to include: Definition of activities for maintaining and monitoring overall PCI DSS compliance, including business-as-usual activities Annual PCI DSS assessment processes Processes for the continuous validation of PCI DSS requirements (for example: daily, weekly, quarterly, etc. as applicable per requirement) A process for performing business-impact analysis to determine potential PCI DSS impacts for 	N/A

A3.1.3 PCI DSS compliance roles and responsibilities must be specifically defined and formally	
assigned to one or more personnel, including at least the following:	
Managing PCI DSS business-as-usual activities	
Managing annual PCI DSS assessments	
Managing continuous validation of PCI DSS requirements (for example: daily, weekly, quarterly, etc.)	
as applicable per requirement)	
Managing business-impact analysis to determine potential PCI DSS impacts for strategic business	
decisions	
decisions	
PCI DSS Reference: Requirement 12	N/A
A3.1.4 Provide up-to-date PCI DSS and/or information security training at least annually to personnel	
with PCI DSS compliance responsibilities (as identified in A3.1.3).	
with Cl 200 compliance responsibilities (as identified in A0.1.0).	
BCL DSS Peference: Peguirement 12	N/A
PCI DSS Reference: Requirement 12	IV/A
A3.2.1 Document and confirm the accuracy of PCI DSS scope at least quarterly and upon significant	
changes to the in-scope environment. At a minimum, the quarterly scoping validation should include:	
Identifying all in-scope networks and system components	
• Identifying all out-of-scope networks and justification for networks being out of scope, including	
descriptions of all segmentation controls implemented	
• Identifying all connected entities—e.g., third-party entities with access to the cardholder data	
environment (CDE)	
PCI DSS Reference: Scope of PCI DSS Requirements	N/A
	N/A
A3.2.2 Determine PCI DSS scope impact for all changes to systems or networks, including additions	N/A

Examples of PCI DSS requirements that should be verified include, but are not limited to: • Network diagram is updated to reflect changes. • Systems are configured per configuration standards, with all default passwords changed and unnecessary services disabled. • Systems are protected with required controls—e.g., file-integrity monitoring (FIM), anti-virus, patches, audit logging. • Verify that sensitive authentication data (SAD) is not stored and that all cardholder data (CHD) storage is documented and incorporated into data retention policy and procedures	

	·
A3.2.3 Changes to organizational structure— for example, a company merger or acquisition, change or reassignment of personnel with responsibility for security controls—result in a formal (internal) review of the impact to PCI DSS scope and applicability of controls.	
PCI DSS Reference: Requirement 12	N/A
A3.2.4 If segmentation is used, confirm PCI DSS scope by performing penetration testing on segmentation controls at least every six months and after any changes to segmentation controls/methods.	
PCI DSS Reference: Requirement 11	N/A
A3.2.5 Implement a data-discovery methodology to confirm PCI DSS scope and to locate all sources and locations of clear-text PAN at least quarterly and upon significant changes to the cardholder environment or processes. Data-discovery methodology must take into consideration the potential for clear-text PAN to reside on systems and networks outside of the currently defined CDE.	
PCI DSS Reference: Scope of PCI DSS Requirements	N/A
A3.2.5.1 Ensure effectiveness of methods used for data discovery—e.g., methods must be able to discover clear-text PAN on all types of system components (for example, on each operating system or platform) and file formats in use. The effectiveness of data-discovery methods must be confirmed at least annually.	
PCI DSS Reference: Scope of PCI DSS Requirements	N/A
A3.2.5.2 Implement response procedures to be initiated upon the detection of clear-text PAN outside of the CDE to include: •Procedures for determining what to do if clear-text PAN is discovered outside of the CDE, including its retrieval, secure deletion and/or migration into the currently defined CDE, as applicable • Procedures for determining how the data ended up outside of the CDE • Procedures for remediating data leaks or process gaps that resulted in the data being outside of the CDE • Procedures for identifying the source of the data • Procedures for identifying whether any track data is stored with the PANs	
Troccoures for identifying whether any track data is stored with the PANS	N/A
A3.2.6 Implement mechanisms for detecting and preventing clear-text PAN from leaving the CDE via an unauthorized channel, method, or process, including generation of audit logs and alerts.	
PCI DSS Reference: Scope of PCI DSS Requirements	N/A
A3.2.6.1 Implement response procedures to be initiated upon the detection of attempts to remove clear-text PAN from the CDE via an unauthorized channel, method, or process. Response procedures must include: • Procedures for the timely investigation of alerts by responsible personnel	
• Procedures for remediating data leaks or process gaps, as necessary, to prevent any data loss	N/A
A3.3 Validate PCI DSS is incorporated into business-as-usual (BAU) activities	N/A

A3.3.1 Implement a process to immediately detect and alert on critical security control failures.	
Examples of critical security controls include, but are not limited to:	
Firewalls	
• IDS/IPS	
- FIM	
• Anti-virus	
Physical access controls	
Logical access controls	
Audit logging mechanisms	
Segmentation controls (if used)	
DOLDOOD 6 DO 1 1 4 40	N/A
PCI DSS Reference: Requirements 1-12	N/A
A3.3.1.1 Respond to failures of any critical security controls in a timely manner. Processes for	
responding to failures in security controls must include:	
Restoring security functions	
• Identifying and documenting the duration (date and time start to end) of the security failure	
• Identifying and documenting cause(s) of failure, including root cause, and documenting	
remediation required to address root cause	
Identifying and addressing any security issues that arose during the failure	
• Performing a risk assessment to determine whether further actions are required as a result of the	
security failure	
Implementing controls to prevent cause of failure from reoccurring	
Resuming monitoring of security controls	
PCI DSS Reference: Requirements 1-12	N/A
A3.3.2 Review hardware and software technologies at least annually to confirm whether they	
continue to meet the organization's PCI DSS requirements. (For example, a review of	
technologies that are no longer supported by the vendor and/or no longer meet the security	
needs of the organization.)	
The process includes a plan for remediating technologies that no longer meet the	
organization's PCI DSS requirements, up to and including replacement of the technology, as	
appropriate.	
PCI DSS Reference: Requirements 2, 6	N/A

	1
A3.3.3 Perform reviews at least quarterly to verify BAU activities are being followed. Reviews must be performed by personnel assigned to the PCI DSS compliance program (as identified in	
A3.1.3), and include the following:	
Confirmation that all BAU activities (e.g., A3.2.2, A3.2.6, and A3.3.1) are being performed	
• Confirmation that personnel are following security policies and operational procedures (for	
example, daily log reviews, firewall rule-set reviews, configuration standards for new	
systems, etc.)	
Documenting how the reviews were completed, including how all BAU activities were	
verified as being in place.	
• Collection of documented evidence as required for the annual PCI DSS assessment	
Review and sign-off of results by personnel assigned responsibility for the PCI DSS compliance program (as identified in A3.1.3)	
Retention of records and documentation for at least 12 months, covering all BAU activities	
Recention of records and documentation for acticust 12 months, covering an DAO activities	
PCI DSS Reference: Requirements 1-12	N/A
A3.4 Control and manage logical access to the cardholder data environment	N/A
A3.4.1 Review user accounts and access privileges to in-scope system components at least	
every six months to ensure user accounts and access remain appropriate based on job	
function, and authorized.	
PCI DSS Reference: Requirement 7	N/A
•	N/A
A3.5 Identify and respond to suspicious events	IWA
A3.5.1 Implement a methodology for the timely identification of attack patterns and	
undesirable behavior across systems—for example, using coordinated manual reviews and/or	
centrally managed or automated log correlation tools—to include at least the following: • Identification of anomalies or suspicious activity as it occurs	
Issuance of timely alerts upon detection of suspicious activity or anomaly to responsible	
personnel	
Response to alerts in accordance with documented response procedures	
PCI DSS Reference: Requirements 10, 12	N/A
